Script Installation Guide

part 1 of 3 of the entire installation process

Step 1)

Upload all files to your website.

Step 2)

Create a MYSQL Database & Username with all permissions

Step 3)

Import the included SQL.txt into your new database

Step 4)

Edit /connect.php and input your correct Database name, user and password. We'll come back to \$gatewayurl later once we set up the CPAlead Widget.

Step 5)

Set up the Cron Job. Go into your site's cpanel, Go to **Cron Jobs** then to **Add New Cron Job**

Get the exact file path to your file **/cron9912ax.php** (hint: to get the exact file path, edit the file in File Manager then before you click "edit" it says *"You will be editing:"*
/home/webmast/public_html/bookity.com/2/cron9912ax.php"

/home/webmast/public_html/bookity.com/2/cron9912ax.php is the path to my cron file, yours will be in around the same format.
This must be correct!

Now copy the exact file path, and go back to the Cron Job page in your cpanel that you were on. If your cpanel is updated like mine,

Click the **Common Settings** drop down menu and click “**Every Minute**” – if you have to fill in the values, just put a * for every one (minutes, hours, days months etc)

Then put this in the **Command:** text field (change MY path to the cron file to YOUR path to the cron file, but LEAVE the php -q in tact!

```
php -q /home/webmast/public_html/bookity.com/2/cron9912ax.php
```

Then click “**Add New Cron Job**”

That's it, for now. Your script isn't completely setup yet, but you need more information to finish it.
